
Corey Redmon

Software Engineer: Java, SQL, Full-Stack Development
redmoncorey1@gmail.com – (803) 372-7871

Professional Summary

Software engineer with 7+ years of experience developing Java and SQL applications for banking and enterprise clients. Experienced in backend services, full-stack development, batch processing, reporting systems, and testing. Known for independently delivering practical, maintainable solutions in consulting environments.

Technical Skills

- Languages: Java, JavaScript, Python, C++
- Backend: SQL, MongoDB, Express, Spring Batch, JPA
- Frontend: React, Angular, HTML/CSS
- Testing: JUnit, Mockito, Selenium, Playwright
- Tools: Gradle, Git, Jira, technical documentation
- Practices: Agile/Scrum, AI-assisted development, requirements analysis, debugging, client support

Work Experience

Lead Software Engineer – Persistent Systems (formerly SCI Fusion360) October 2021 – May 2026

- Delivered end-to-end Java and SQL solutions for banking workflows, working independently from requirements analysis through implementation, testing, and deployment preparation.
- Enhanced a Spring Batch fraud detection application that processed payment data from SQL, responded to MQ-triggered workflows, and integrated with Orbograph fraud-analysis services.
- Designed and implemented automated database purging for fraud detection product data, including Spring Batch metadata tables, using JPA entities, repositories, services, readers, writers, and keyset pagination, and developed comprehensive JUnit/Mockito tests targeting key edge cases.
- Built a scheduled mortgage reporting Java task for IBM Financial Transaction Manager that exported payment records into strict fixed-width file formats with headers, payment records, encoding requirements, variable runtime parameters, and automated file splitting.
- Created a Gradle deployment tool that used Git diff to identify changed resources, package branch-specific artifacts, and automatically generate deployment mapping files that developers previously created manually.
- Improved the client team's Git workflow by recommending feature-branch practices, writing workflow documentation, and training developers through onboarding sessions and presentations.

Associate Software Developer – SCI Fusion360

January 2019 – October 2021

- Supported multiple banking clients and IBM Financial Transaction Manager projects in consulting and vendor-representative roles, delivering maintenance changes and Java applications.
- Represented IBM on Financial Transaction Manager support work, investigating product defects and communicating with banking clients to understand and resolve application issues.
- Expanded test coverage for BB&T's internal Zelle support application by adding hundreds of JUnit test cases across dozens of test classes for a previously untested operator-facing transaction lookup tool.
- Delivered targeted enhancements and bug fixes for an iOS retail marketing application within limited maintenance-budget constraints.

Teaching Assistant – Clemson University School of Computing

August 2017 – December 2018

- Led Algorithms and Data Structures lab sessions, creating lessons that explained programming assignments, core data structures, and problem-solving strategies.
- Provided weekly office-hour support for programming, debugging, algorithms, and data-structure questions.
- Served as grading lead for multiple courses, creating grading guides, reviewing programming assignments, and ensuring consistent technical feedback.

Certifications

- Professional Scrum Master I – Scrum.org
- Playwright 101 – LambdaTest
- Selenium Java 101 – LambdaTest

Education

Master of Science, Computer Science
Clemson University

December 2018

Bachelor of Science, Computer Science
Clemson University

May 2017
